

## Security Screening Kiosk

Another favorable screening device used during the World Cup was developed by an American homeland security technology company based in Silicon Valley, Qylur Security Systems. The Brazilian government used Qylur's security screening solution at the Arena da Baixada in Curitiba, Brazil, to ease and facilitate the process of screening the spectators. "Qylur's fan-friendly, multi-threat screening solution for bags and IDs comprises of five concurrently operating screening pods. Leveraging technologies such as intelligent machine learning and fused multi-sensors, the screening solution tackles the ever-changing face of security threats. The solution was used to screen the bags of thousands of fans and detect threats as well as prohibited items, allowing both automated and collaborative detection." In the World Cup matches at the stadium, "it enables staff to handle a large flow of incoming fans, reliably detect threats, stop prohibited items per the stadium policy, all while maintaining the festive atmosphere and supporting the entertainment and welcoming aspect of an entrance to a world-class event," stated Lisa Dolev, CEO and Founder of Qylur Security Systems. Luckily for Qylur, all installations in preparation of the World Cup proceeded much smoother than expected, especially in terms of physical installation, electrical connection, availability of personnel for training, weather protection, and flexibility of stadium operations staff, according to Dolev.

BY THE ASSESSMENT TEAM

Hosting the World Cup event for the second time since 1950, Brazil aimed high to make this year's 2014 FIFA World Cup the most secured World Cup event in history by employing high-caliber physical security equipment.

▲ The Qylatron is a fully integrated security screening system that uses sensor-based fusion technology to power screening solutions.
